The Five Essential Rules Of Wine Storage

Vintec and Transtherm wine cellars ensure your wines are stored in the ideal cellaring conditions by respecting these 5 wine storage rules.

1

1) Stable Temperature between 12°-14°

Temperature fluctuations denature your wines. In particular, temperatures above 25° will ruin wine within a couple of weeks and create “spoiled fruit” flavours. >

2

2) Humidity above 50%

Levels lower than this cause corks to dry out and shrink, allowing damaging air into the wine, creating oxidation and off-odours. >

3

3) Dark storage area

All light should be avoided, but UV light in particular: it creates hydrogen sulphide compounds in wine and affects the tannins and the colour of your wine. >

4

4) No vibrations

Imperceptible vibrations prematurely deteriorate wine by speeding up chemical reactions and ageing. >

5

5) Airflow

Lack of appropriate ventilation and air change makes wine cellars become stale and mouldy. >

The Vintec and Transtherm Solution

Our wine cabinets maintain stable temperature thanks to:
1) interaction between a compressor and a thermostat
2) insulated side panels 3) double/triple-glazed doors.

Our wine cabinets incorporate a Thermal Pump System which ensures adequate humidity levels are maintained (50% or greater). The Thermal Pump works by heating condensed water, which is then introduced as humid air within the cabinet.

Our wine cabinets eliminate this threat by incorporating: 1) UV-treated tinted glass doors 2) dark interiors 3) dimmed LED lights.

To protect the quality of your wine, our wine cabinets create a vibration-proof environment by including the following: 1) an externally-housed compressor 2) rubber shock absorbers 3) vibration absorbing wooden shelves.

Vintec wine cabinets include internal and external fans to ensure that there is a slow reticulated air flow throughout the cabinet. The larger Vintec models also include a carbon filter to limit any odours penetrating the wine cabinet.
